

Download and Extract

An initial setup of files is provided to you via a shell script: [Download potd-q22](#)

Using a terminal, extract the initial files by running the shell script you just downloaded (you will need to navigate to the directory where you saved the file):

```
sh potd-q22.sh
```

Your files for this problem will be in the `potd-q22` directory.

The Problem

Complete the `listIntersection` function that accepts two `Node *` (the heads of two linked lists) and returns a `Node *` that points to the head of a new linked list. This function must create a new list (containing new nodes, allocated on the heap) that contains the set intersection of the values in both lists.

For example:

```
List 1: 0 1 2
List 2: 2 3 4
Intersection: 2
```

```
List 1: 0 2 2 2
List 2: 0 0 0 4
Intersection: 0
```

The order of nodes in your new list does not matter, only that it is a proper set intersection. A `main` function has been provided that exercises your `listIntersection` function.

Upload Solution

Drop files here or click to upload.

Only the files listed below will be accepted—others will be ignored.
