Download and Extract

An initial setup of files is provided to you via a shell script: [Download potd-q13](#)

Using a terminal, extract the initial files by running the shell script you just downloaded (you will need to navigate to the directory where you saved the file):

```
sh potd-q13.sh
```

Your files for this problem will be in the `potd-q13` directory.

The Problem

In `potd.h`, write a templated function `more` which takes in two variables of the same type and returns whichever variable is greater than (`>`) the other.

You will also need to update the `Food` class in order for `more` to be able to be called properly.

Expected Output

```
We have more apples.
```

Upload Solution

Drop files here or click to upload.

Only the files listed below will be accepted—others will be ignored.
